Assignment – I
Problem Solving with Python

1. Write a program to find numbers between 12345 and 7654321 (both included) where each digit of a number is an even number. How many such numbers are there?

2. Write a program that accepts a positive number and subtract from this number the sum of its digits. Keep repeating this process until the number becomes negative or zero. Enter below the number of such operations required for input "9721"
